What is the Arm & Hammer Forage Testing Program[™]?

Arm & Hammer Animal Nutrition partnered with several forage testing laboratories to promote and provide education on the importance of ration dietary cation-anion difference (DCAD) balancing.

Participating producers and nutritionists submitted up to three forage samples for complimentary macromineral analysis by wet chemistry. The results help to properly develop rations based on recommended DCAD levels for pre- or postpartum cows.

What is DCAD and why is it important?

Balancing rations for DCAD is important for keeping cows healthy, productive and profitable. DCAD is the difference between positively charged cations—sodium and potassium—and negatively charged anions—chloride and sulfur—in the bloodstream, measured in milliequivalents (meq) per 100 grams of ration dry matter.

Results

North Central Samples				Northeast Samples			
Sample Type	Average DCAD	Minimum	Maximum	Sample Type	Average DCAD	Minimum	Maximum
Legume Silage	46.9	-5.67	99.84	Legume Silage	42.46	15.48	59.23
Corn Silage	14.59	-0.35	45.93	Corn Silage	14.03	1.11	29.28
Small Grain Silage	35.38	11.18	77.99	Grass Silage	27.83	20.5	41.41
Balage	22.94	9.04	25.52	Small Grain Silage	48.25	36.46	60.05
Legume Hay	45.62	33.33	83.36	Grass Hay	28.11	14.28	56.5
Grass Hay	21.48	-19.95	70.57	Includes forage samples from OH, PA and NY			

Over 1,100 forage samples were collected and analyzed during the program. Results by geographic region are shown below.

Includes forage samples from SD, ND, MN, WI, MO, IL and MI

Monitor DCAD Throughout All Production Phases

Recommended DCAD Levels ¹ (meq/100g ration dry matter)								
Production Phase	DCAD Levels	Why	How	Benefits				
Early Lactation Mid to Late Lactation	+35 to +45 +35	Maintain cation levels for optimum milk production	DCADE The Plus Forage Needs	Promotes herd health and enhances milk and component production and helps mitigate heat stress				
Close-up	-8 to -12	Maintain anion levels to avoid metabolic issues postpartum	BIO-CHLOR ° Make Transition Count	Helps cows avoid costly metabolic disorders, and sets the stage for a successful subsequent lactation				

Bottom Line

- Most average DCAD levels fell within accepted book values, but individual samples, as noted above, displayed wide variability.
- Regular forage testing is imperative to provide an accurate picture of DCAD levels from your forages.
- Without macromineral testing, it's impossible to know the supplemental cations or anions needed to balance the proper ration for your cows in different production cycles.
